

Adding and Configuring a Network Printer Using Its IP Address

1. The IP address from printer's network settings is obtained. The IP address tells the computer exactly where the printer is on the network.

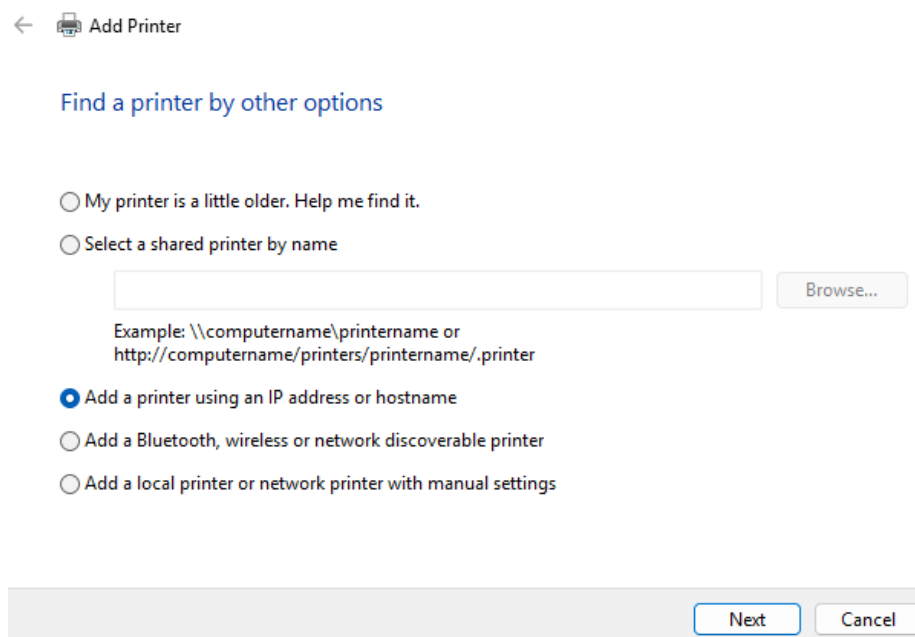

In printers and scanners settings, Windows allows one to add, remove, and manage printers. Selecting "Add device," tells Windows that I want to add another printer.

2. Clicking the option below because I want to add the printer manually using its IP address instead of letting the computer search it automatically.

3. Selecting that option because I know the printer's IP address.

4. The computer will use the printer's IP address to find and communicate with the printer. IPP is the protocol Windows will use to talk to that network printer.

←  Add Printer

Type a printer hostname or IP address

Device type:

Hostname or IP address:

Autodetect detects WSD and TCP/IP printers.
To search for an IPP printer, IPP must be selected from the drop down menu.

Next Cancel

5. The computer is checking whether it can communicate with the printer.

←  Add Printer

Type a printer hostname or IP address

Device type:

Hostname or IP address:

Contacting printer...

Autodetect detects WSD and TCP/IP printers.
To search for an IPP printer, IPP must be selected from the drop down menu.

6. The network printer is then added successfully and is ready to use. The test page confirms that the computer can communicate with the printer and print successfully.
