

CREATING USER IN AN OU

1. Selecting **User must change password at next logon** gives the user a temporary password now, but when they log in for the first time, they are required to create a new password that only they know.

New Object - User

Create in: atushe.com/Finance

Password: [masked]

Confirm password: [masked]

☒ User must change password at next logon

☐ User cannot change password

☐ Password never expires

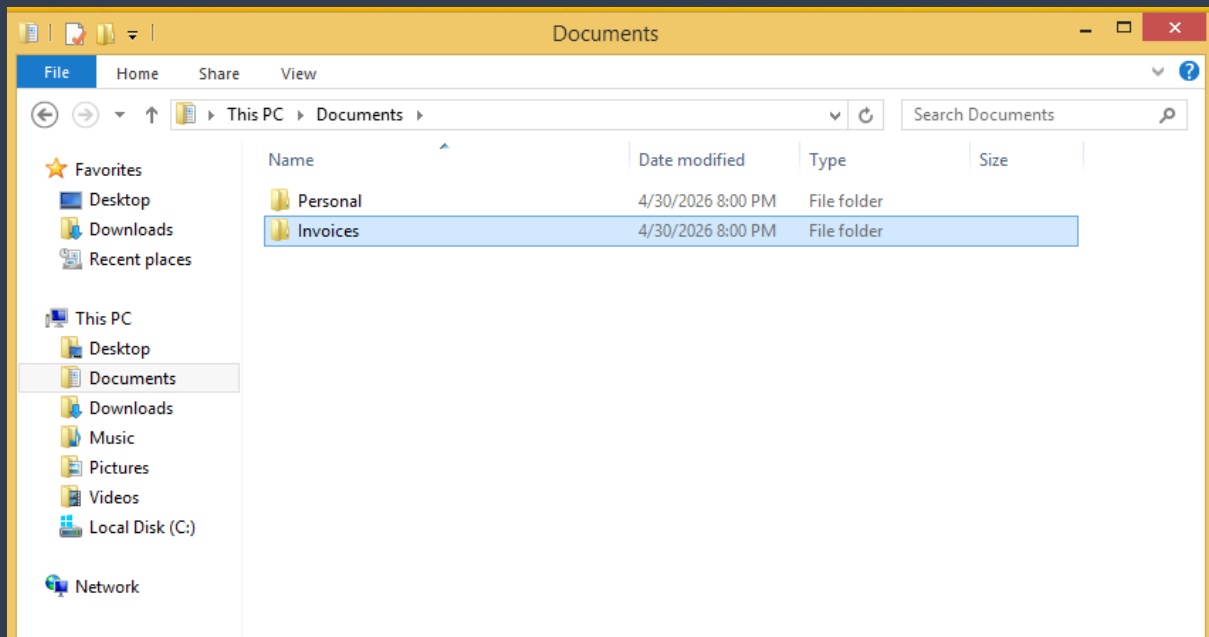

☐ Account is disabled

SHARING /PERMISSIONS

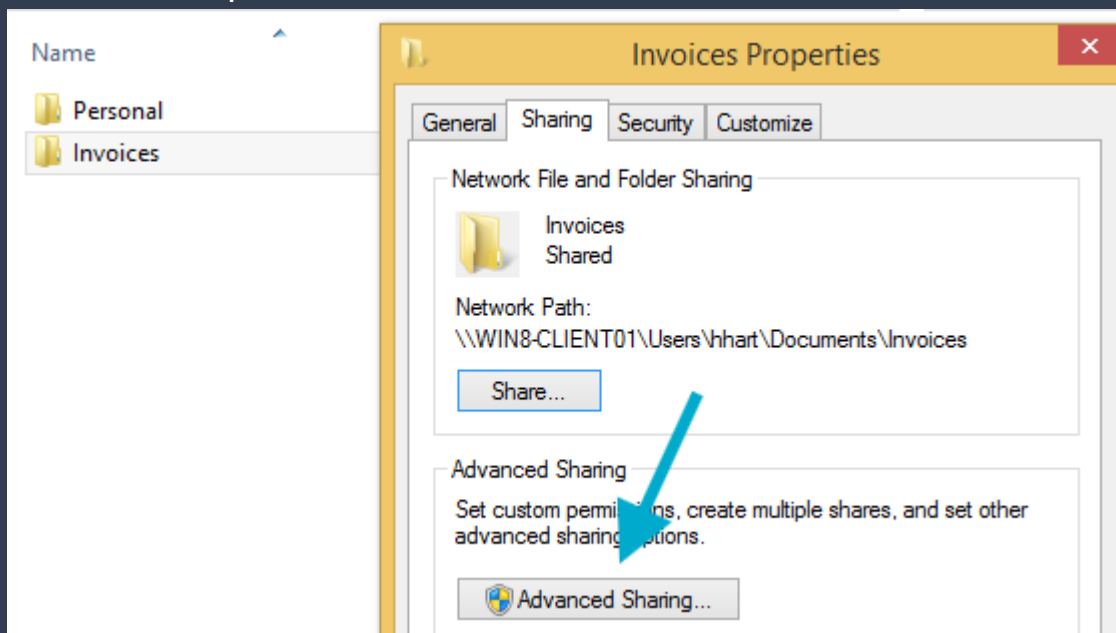

Users in the Finance group each have their own folder, and a shared folder was created between two users in the same OU. This is called **Network Sharing**

1. Each user has a Personal and Invoices folder

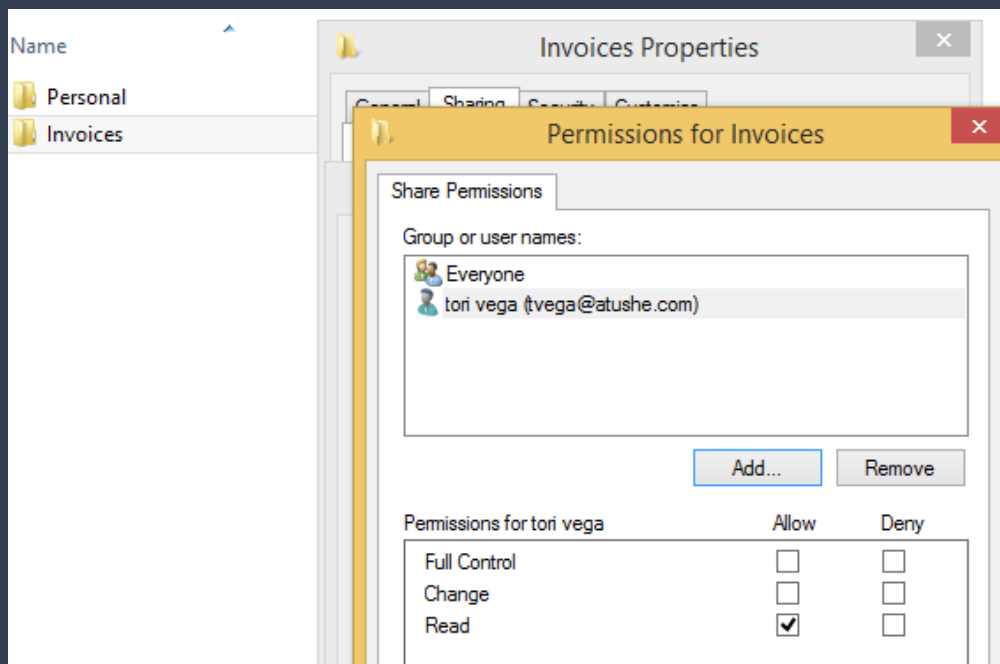

2. Sharing folder **Invoices** between two users in the finance group.

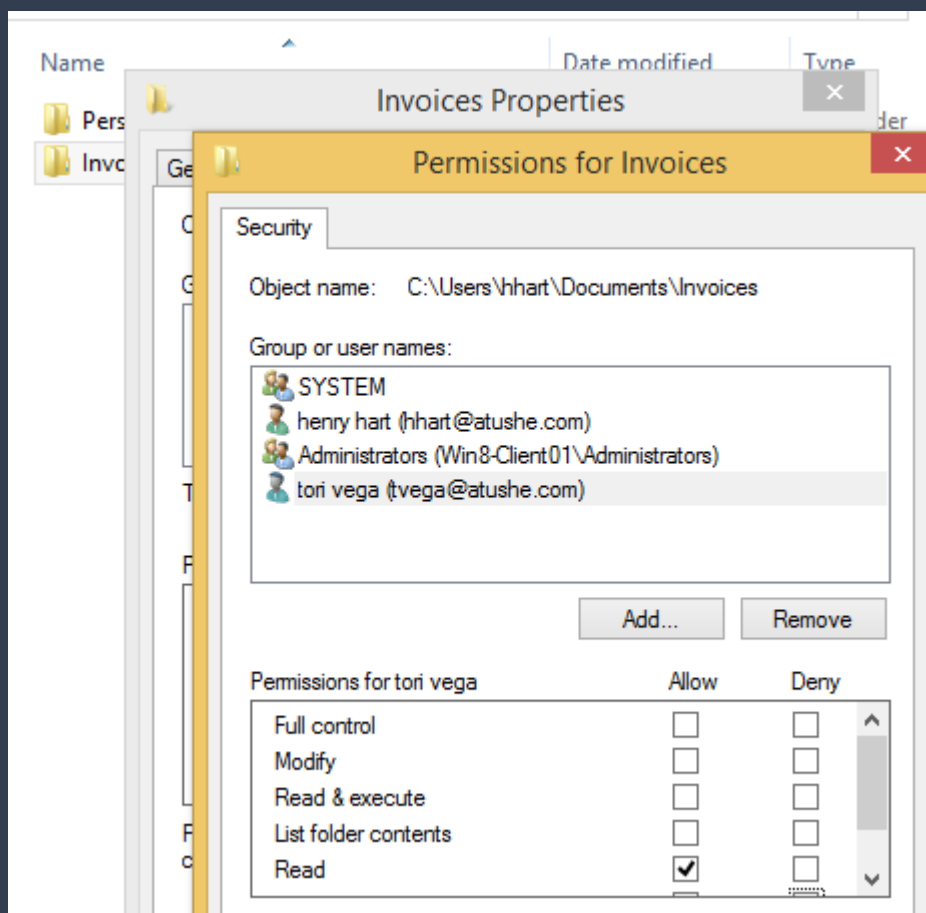

On user computer A :

3. Entering name of user that can access the folder but that user only has read permission .These steps enable network sharing to set who can access the folder over the network.

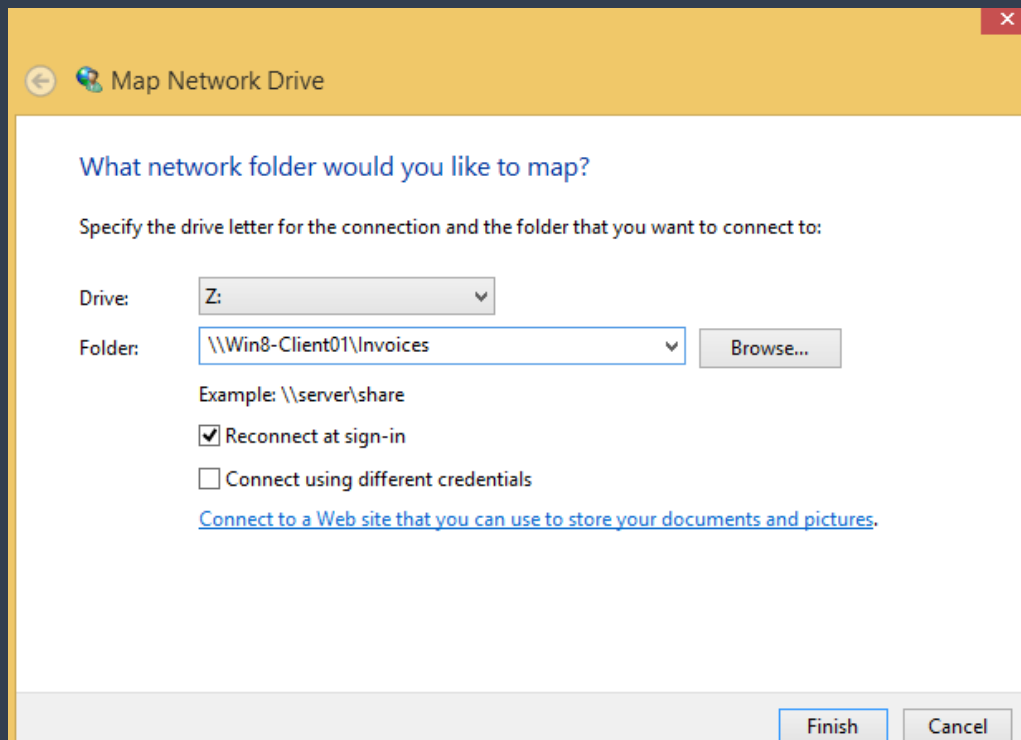

4. These steps enable NTFS to control exactly what a user can do inside the folder.

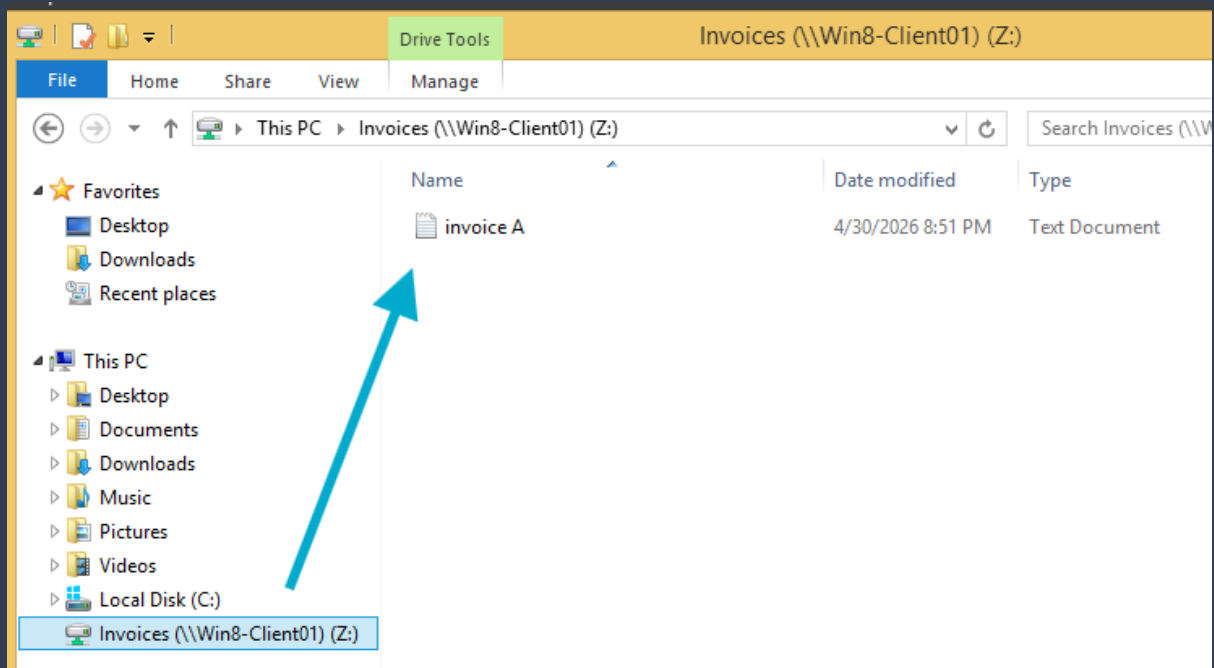

MAPPING NETWORK DRIVE

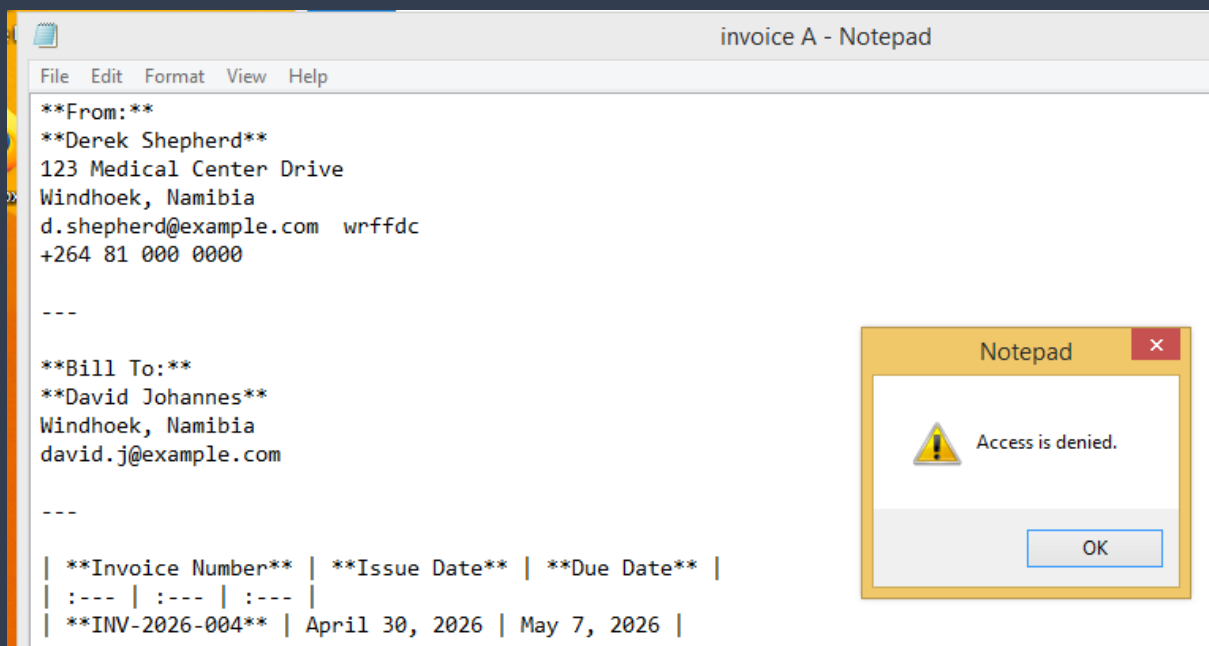

5. To make the shared folder easier to access, it is mapped as a network drive so that instead of typing the network path each time, the user can open it like a local disk on their computer.

6. Every time the user logs in, the **Invoices** folder will appear under **This PC** next to the C: drive, as if it were a local drive on their computer.

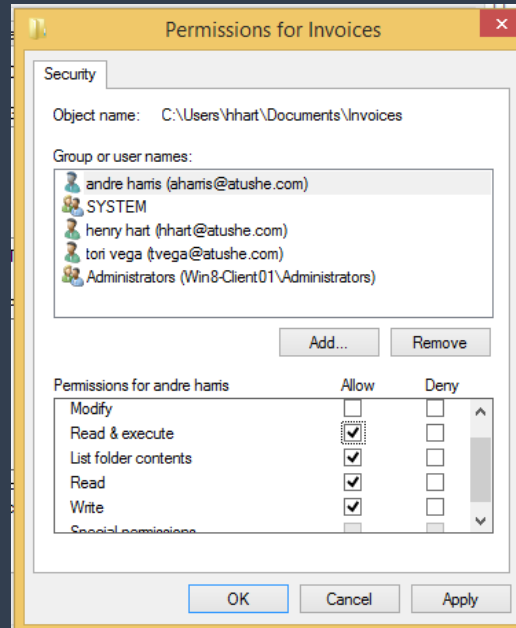

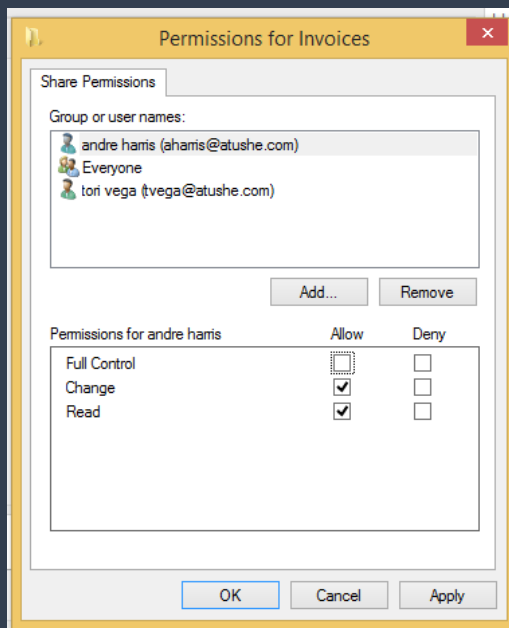

7. Test whether the user's permissions are applied correctly. The user should only have read access to the contents of the **Invoices** folder.

Access is denied because they tried to probably write or delete the contents inside the folder

8. Giving another user (andre harris) access to the folder with write permission

9. The user (andre harris) can write, add files, make changes, and save them, but cannot delete files.
